## End Semester Even/Debarred Backlog Examinations 2025

B. Tech (Common to all)

**Programming For Problem Solving** 

Time: 3 Hours

Semester: II Sub. Code: TCS201 Maximum Marks: 100

## **Instructions:**

- (I) All the questions are compulsory.
- (II) Answer any two sub-questions among a, b and c in each of the main questions.
- (III) Each main question carries 20 Marks.
- (IV) Each sub-question carries 10 Marks.

[10]  (a) Illustrate with a fragment of C code and explain the compile time and run time initialization of 1-D and 2-D character arrays. [10]  (b) Draw a flowchart and write a C program that reads a sentence from the standard input device separated by single space between the words. Design a UDF 'SubStr' that returns a sub-string through its argument to the calling program by taking the starting position and ending position as arguments to the function. Display the sub-string in the calling program. [10]  (c) Write an algorithm and implement a C program to read an entire string in lowercase or uppercase from the keyboard then replace the character at the middle of the string by the character 'X'. If the string read is of even length, then ignore it. Display the modified string to the screen. Implement without using any in-built function. For Ex.  Sample Input: PROGRAMMING Sample Output: PROGRXMMING Sample Output: merchandise  Sample Output: merchandise  [10]  Q2  (10X2=20 Marks)  (a) Assume a pointer pointing to a floating-point number. Elaborate the meaning of pointing to an address and dereferencing of its value with a snippet of C code. Implement a C program to read N numbers from the keyboard into an array. Using a pointer display their sum and average to the screen. [10]  (b) Assume a character array STR[]={"CALENDAR YEAR2023"}. Develop a C program using a pointer to segregate the string and the number into two different variables without using any built-in function. Display the string and the number to the output. Draw a flowchart for the same. [10]  (c) Design a C program that reads the details of N items such as ItemCode, Name, Qty and Price into a structure. Display the Total Amount in Rupees worth of inventory of N items to the console. Sample Input: N=3  101 ITEM1 100 55.00  102 ITEM2 50 10.50  103 ITEM3 30 20.10	(1)		,
initialization of 1-D and 2-D character arrays. [10]  (b) Draw a flowchart and write a C program that reads a sentence from the standard input device separated by single space between the words. Total amount worth of 3 Items in Rs. is 6628 [10]			
		Total amount worth of 3 Items in Rs. is 6628 [10]	

```
Q3
                                                                        (10X2=20 Marks)
(a)
      How structure is different from union in C. Illustrate with an example.
      Implement a C program to read the details of a device such as Device ID (Assume it
      as an integer type), Device Name (Assume character string of not more than 50
      characters) and Device Number (assume an integer type) into a union. Display the
      amount of memory allocated in bytes by the union to the console. Justify your answer.
                                                                                            CO-4
                                                                                            & 5
(b)
      Open a file "Data.txt" present in the current default path with file pointer set at 50
      bytes offset from the beginning of the file. Read the next 100 characters from the
      position of the current file pointer and display the same to the standard output device
      by converting all the alphabets into uppercase.
      Explain in brief the meaning of the following functions with a fragment of C code:
(c)
                                                                             [2.5 \times 4=10]
          i) fprintf
          ii) fseek
          iii) ftell
          iv) rewind
Q4
                                                                         (10X2=20 Marks)
                                                                                            CO-1,
(a)
      Predict the output of C and Python code:
                                                                              [2 \times 5 = 10]
                                                                                            3,5 &
      #include<stdio.h>
                                                                                            6
      int main()
           char str[] = "Mindful";
           printf ("%c", str[3] - 3);
           return 0;
      }
      #include <stdio.h>
      int main()
         int x[]=\{10,15,20,25,30\};
         int i,*p=x;
         for(i=0;i<4;i++){
           p=*p+5;
           p=p+1;
           *p=20;
           printf("%d ",x[i]);
         }
      return 0;
      #include <stdio.h>
      int main()
```

```
char str[50];
      FILE *fp=fopen("Para.txt","w+");
      fprintf(fp, "Stitch in time saves nine");
      fseek(fp,-10L,2);
      fscanf(fp,"%5s",str);
      printf("%s",str);
      fclose(fp);
      return 0;
      iv) Code in Python
      words= "Tic Tac Toe"
      print(words[::-1])
      print(words[-3:])
      v)
      dt=\{\}
      collection=["A","BB","CCC","DDDD"]
      for w in collection[::-1]:
          if w not in dt:
                dt[w] = len(w)*2
      print(dt)
      Enumerate the important features of Python programming language. Demonstrate
      with a Python code the usage of the exponential operator, integer division and short-
      circuit operator.
      Using snippet of Python code demonstrate the use of the following functions:
(c)
                                                                                [2.5 \times 4=10]
          i)
                range
          ii)
                extend
          iii)
                sort
          iv)
                remove
                                                                                                CO-5
Q5
      (10 \text{ X } 2 = 20 \text{ Marks})
      Write a python script to read a string from the user and display it by capitalizing the
                                                                                                & 6
      alternate letter present in it to the console.
      Sample Input:
      "mountaineering"
      Sample Output:
      "MoUnTaInEeRiNg"
      "List is mutable while tuple is immutable" Justify the statement with similarities
(b)
      and differences between a list and a tuple with a python code. Write a python script to
      append N city names and their population to a list and display the same.
                                                                                         [10]
(c)
      Illustrate the concept of file handling in Python. Assume a file "sample.txt" present in
      the current drive. Write a python code to display the count of lines present in it to the
      output screen. Assume each line is terminated by a newline character.
                                                                                         [10]
```
